SHUBHA PATRO (“iA’Ò *“é$”Ù0”²•

Official Google Cloud Run Deployment & Update Manual (shubhapatro.com)

1. Overview & Setup Architecture

Your application is built with React, Vite, and an Express backend, packaged inside Docker, and hosted on Google Cloud Run. Your custom domain shubhapatro.com is connected via Cloudflare DNS pointing directly to Google Cloud Anycast IPs.

- **Google Cloud Project: hamropatro-app-live**
- **Cloud Run Service Name: shubhapatro**
- **Primary Region: asia-east1 (Taiwan / East Asia)**
- **Live Production Domain: https://shubhapatro.com & https://www.shubhapatro.com**
- **Container Port: 8080 (Cloud Run HTTP proxy)**

2. Standard Update Workflow (Step-by-Step)

Whenever you make edits to your code and want to deploy the changes to your live site, follow these 3 simple steps:

Step A: Push Your Updates to GitHub

On your local computer or AI Studio workspace, commit and push your changes to your repository:

```
git add .
git commit -m "Update features and content"
git push origin main
```

Step B: Open Google Cloud Shell & Pull Latest Code

Go to shell.cloud.google.com in your web browser. In the Cloud Shell terminal, navigate into your folder and pull the latest code:

```
cd ~/shubhapatro
git pull origin main
```

Step C: Deploy to Google Cloud Run (Single Command)

Run this exact command to build the updated container and deploy it live with zero downtime:

```
gcloud run deploy shubhapatro \
  --source . \
  --project hamropatro-app-live \
  --region asia-east1 \
  --platform managed \
  --allow-unauthenticated \
  --port 8080 \
  --memory 512Mi \
  --cpu 1
```

Cloud Build will build the new Docker image and update the Cloud Run revision automatically. Your live traffic seamlessly shifts to the new revision once healthy.

SHUBHA PATRO — Deployment & Maintenance Guide

3. Quick One-Click Deploy Script

Inside your ~/shubhapatro directory in Cloud Shell, you also have the deploy-gcloud.sh script. You can simply run:

```
./deploy-gcloud.sh
```

4. Cloudflare DNS Configuration Reference

Your DNS records in Cloudflare should stay configured as follows (Proxy status MUST remain "DNS only" / Gray Cloud for Google managed certificates):

- **A Record:** @ -> 216.239.32.21 (DNS only / Gray cloud)
- **A Record:** @ -> 216.239.34.21 (DNS only / Gray cloud)
- **A Record:** @ -> 216.239.36.21 (DNS only / Gray cloud)
- **A Record:** @ -> 216.239.38.21 (DNS only / Gray cloud)
- **CNAME Record:** www -> ghs.googlehosted.com (DNS only / Gray cloud)

5. Troubleshooting & Useful Commands

A. Check Live Server Logs

To monitor live traffic, errors, or verify Forex/Bullion API requests:

```
gcloud run services logs read shubhapatro --region asia-east1 --project hamropatro-app-live --limit 50
```

B. Check Custom Domain Certificate Status

Verify the SSL certificate issuance status on Google Cloud:

```
gcloud beta run domain-mappings describe --domain shubhapatro.com --region asia-east1 --project hamropatro-app-live
```

C. If "npm ci" Error Occurs in Docker

The Dockerfile is configured with "npm install" to prevent package-lock mismatches. If ever needed, verify your Dockerfile contains:

```
RUN npm install
RUN npm run build
```
